CMSC 341

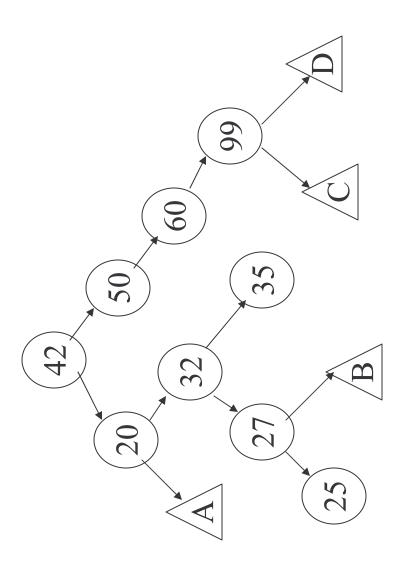

Binary Search Trees

Binary Search Tree

than the value at v and the values stored in the right subtree node v, the values stored in the left subtree of v are less A Binary Search Tree is a Binary Tree in which, at every are greater.

The elements in the BST must be comparable. Duplicates are not allowed in our discussion. Note that each subtree of a BST is also a BST.

A BST of integers

Describe the values which might appear in the subtrees labeled A, B, C, and D

2/21/2006

BST Implementation

The SearchTree ADT

- A search tree is a binary search tree which stores homogeneous elements with no duplicates.
- It is dynamic.
- The elements are ordered in the following ways
- inorder -- as dictated by operator
- preorder, postorder, levelorder -- as dictated by the structure of the trer

```

 ∞

Performance of "contains"

Searching in randomly built BST is O(lg n) on average - but generally, a BST is not randomly built

Asymptotic performance is O(height) in all cases

o

The insert Operation

```

Predecessor in BST

data value that immediately precedes the data at v in order. Predecessor of a node v in a BST is the node that holds the

Finding predecessor

- v has a left subtree
- then predecessor must be the largest value in the left subtree (the rightmost node in the left subtree)
- v does not have a left subtree
- predecessor is the first node on path back to root that does not have v in its left subtree

Successor in BST

Successor of a node v in a BST is the node that holds the data value that immediately follows the data at v in order.

Finding Successor

- v has right subtree
- successor is smallest value in right subtree (the leftmost node in the right subtree)
- v does not have right subtree
- successor is first node on path back to root that does not have v in its right subtree

The remove Operation

```
else if ( t->left != NULL && t->right != NULL ) // two children
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  t->right;

Performance of BST methods

What is the asymptotic performance of each of the BST methods?

	Best Case	Worst Case	Average Case
contains			
insert			
remove			
findMin/Max			
makeEmpty			
assignment

Building a BST

Given an array/vector of elements, what is the performance (best/worst/average) of building a BST from scratch?

17 2/21/2006

Tree Iterators

As we know there are several ways to traverse through different kind of iterators. The iterator type defines a BST. For the user to do so, we must supply how the elements are traversed.

```
LevelOrderIterator<T> *LevelOrderBegin();
                                                                                                                PostOrderIterator<T> *PostOrderBegin ();
                                                       PerOrderIterator<T> *PreOrderBegin();
InOrderIterator<T> *InOrderBegin();
```

Using Tree Iterator

```
BST<int>::InOrderIterator<int> itr = tree.InOrderBegin();
                                                                                                                                                                                                 while ( itr != tree.InOrderEnd())
                                                                                                             // store some ints into the tree
                                                                                                                                                                                                                                                                                                               // do something with x
                                                                                                                                                                                                                                                    int x = *itr;
                                                     BST<int> tree;
                                                                                                                                                                                                                                                                                                                                                                      ++itr;
main ()
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            12/19/2006
```

BST begin() and end()

```
// BST InOrderBegin() to create an InOrderIterator
                                                                                                                                                                                                                                                                                                                                  // BST InOrderEnd( ) to signal "end" of the
                                                                                                                                                                                                                                                                                                                                                                                                                             InOrderIterator<T> BST<T>::InOrderBegin()
                                                                                         InOrderIterator<T> BST<T>::InOrderBegin()
